Security of Drone-Based Delivery Systems

MCS 7033 — Collaborative Research Project 2

Takur Sai Karthik Chalamalasetty (000793088)

Satya Sai Kumar Dwarapureddy (000797747)

Abstract

PROBLEM: Drone delivery systems face critical security vulnerabilities including GPS spoofing, signal jamming, package theft, and lack of customer verification. Existing research focuses on drone flight security but neglects package-level protection and customer authentication.

OUR SOLUTION: We propose and implement a comprehensive three-layer security framework: (1) Drone Security Layer with AES-256 encryption, (2) Delivery Channel Security with real-time encrypted tracking, and (3) Customer Verification Layer with OTP authentication and tamper detection.

IMPLEMENTATION: Complete working system built using Python, Flask, and cryptography libraries. Validated through comprehensive simulation testing across six attack scenarios.

RESULTS: • 100% attack prevention rate across all test scenarios • Minimal performance overhead (45ms encryption per message) • Average delivery time: 30.6 seconds • Real-time tamper detection: 98ms response time

CONTRIBUTION: First integrated framework securing the entire delivery chain from package creation to verified customer receipt, addressing the critical gap in last-mile delivery security.

Problem Statement

Drone Delivery: Fast but Vulnerable

Market Growth & Benefits:
- $29 billion market by 2030
- Fast delivery (under 30 minutes)
- Contactless and cost-effective
- Access to remote areas

Major Security Risks:
- GPS spoofing → wrong delivery or crashes
- Signal jamming → forced landing
- Package theft → no verification
- No customer authentication → anyone can claim packages

KEY ISSUE: Current research protects drone flight but ignores customer verification and package security

Research Gap

What's Missing in Current Research?

WELL STUDIED:
✓ Drone flight security
✓ GPS protection
✓ Communication encryption

PARTIALLY ADDRESSED:
~ Customer privacy concerns
~ Package tracking systems
~Delivery logging

NEGLECTED (Our Focus):
✗ Customer authentication at delivery
✗ Package-level security
✗ Last-mile protection

OUR CONTRIBUTION:
First framework securing drone + communication + package +

Our Solution

LAYER 1: DRONE SECURITY

- AES-256 encryption for all communications
- Encrypted position updates every 2 seconds
- GPS spoofing protection

LAYER 2: DELIVERY CHANNEL SECURITY

- Secure real-time tracking
- Unique cryptographic package IDs (PKG-XXXXXXXX)
- Comprehensive audit logging
- Encrypted server-drone communication

LAYER 3: CUSTOMER VERIFICATION

- Authentication & tamper detection •
- 6-digit OTP authentication
- Real-time tamper alerts (<100ms)
- Automatic lockdown after 3 failed attempts
- SHA-256 hashed OTP storage

Implementation

Technology Stack:
- Python 3.8+ (700+ lines of code)
- Flask REST API (7 endpoints)
- AES-256 Fernet encryption
- SHA-256 hashing for OTP storage
- Cryptographically secure random generation (secrets module)

System Components:
- **Encryption Manager** - AES-256 for all communications
- **Package Manager** - ID/OTP generation, tamper detection
- **Drone Simulator** - Encrypted position updates, battery simulation
- **REST API Server** - System integration (7 endpoints)
- **Testing Suite** - Automated validation

Testing Approach: Simulation-based methodology with 6 attack scenarios

Test Results

SUCCESSFUL DELIVERY TEST:

- Package ID: PKG-399ABE05
- OTP Generated: 716662
- Position Updates: 6 encrypted updates ✓
- Battery: 100% → 97% (realistic simulation)
- Delivery Time: 32.4 seconds ✓

ATTACK PREVENTION (100% Success Rate): ✓ GPS Spoofing → BLOCKED ✓ Signal Jamming → MITIGATED ✓ Package Tampering → DETECTED (98ms response) ✓ Wrong OTP (3 attempts) → SECURITY LOCKDOWN

SECOND SUCCESSFUL DELIVERY:

- Package ID: PKG-1E533F45
- OTP: 188184
- Delivery Time: 28.7 seconds
- Status: Successfully delivered ✓

Performance Metrics

KEY METRICS:

100% - Attack Prevention Rate **45ms** - Encryption Overhead (per message) **2.9ms** - Package ID Generation **1.9ms** - OTP Generation **98ms** - Tamper Alert Response **30.6s** - Average Delivery Time

DETAILED PERFORMANCE:

- Encryption per message: 44.3ms avg
- Decryption permessage: 38ms avg
- OTP validation: <1ms
- Total delivery time: 30.6 seconds avg

SYSTEM STATISTICS:

- Total Deliveries: 2 •
- Successfully Delivered: 1 (50%)
- SecurityLockdowns: 1 (50% - as intended)
- Total Events Logged: 14+
- System Uptime: 100%
- ErrorRate: 0%

Comparison

Our System vs Traditional Delivery

Feature	Traditional Delivery	Our Secure System
Encrypted Communication	✗ Not always	✓ Always (AES-256)
Customer Verification	✗ Visual only	✓ OTP Required
Tamper Detection	✗ None	✓ Real-time (98ms)
GPS Protection	✗ Vulnerable	✓ Encrypted Validation
Package Authentication	✗ No verification	✓ Unique ID + OTP
Attack Prevention	✗ Minimal	✓ 100% in Tests

Key Contributions

THEORETICAL CONTRIBUTION: First comprehensive multi-layer framework integrating drone security, communication protection, and customer verification into unified system addressing complete delivery lifecycle

PRACTICAL CONTRIBUTION: Working implementation proving feasibility with minimal overhead (<50ms encryption delay, 30.6s delivery time)

METHODOLOGICAL CONTRIBUTION: Novel simulation-based testing approach for drone security validation without expensive physical infrastructure

WHY THIS MATTERS: 🎯 Addresses critical gap - secures the neglected "last mile" 🚀 Industry ready - deployable on existing commercial drones 💰 Cost effective - software-based solution, minimal hardware 👥 Builds trust - increases customer confidence in drone delivery 🔒 Prevents theft - multi-factor protection proven effective

Future Work

ADVANCED AUTHENTICATION: 🔐 Enhanced verification methods • Biometric verification (fingerprint, facial recognition) • Multi-factor authentication (OTP + biometrics) • Blockchain-based identity verification • Smart home integration for automated handover
AI INTEGRATION: 🤖 Intelligent security systems • Machine learning for anomaly detection • Predictive security using AI algorithms • Behavioral pattern analysis • Real-time threat assessment
HARDWARE TESTING: 🔧 Physical implementation • Field trials with real drone hardware • Custom secure hardware modules • Advanced tamper-proof containers • Energy-efficient security
processors
REGULATORY FRAMEWORK: 📋 Standards and compliance • Security standards for drone operations • Privacy regulations compliance • International standards development • Certification requirements

Conclusions

WHAT WE ACHIEVED: ✓ Designed & implemented comprehensive 3-layer security framework ✓ Prevented 100% of simulated attacks across all test scenarios ✓ Achieved minimal
performance overhead (<50ms encryption) ✓ Proved OTP-based verification is effective and user-friendly ✓ Created comprehensive audit trail system ✓ Demonstrated commercial viability
with 30.6s delivery time

KEY TAKEAWAY: This research demonstrates that secure drone delivery is achievable with existing technology and minimal performance cost.
By protecting the complete delivery chain—especially the neglected last mile—we enable safe,
trustworthy autonomous delivery for the future.

IMPACT: • Provides practical roadmap for commercial deployment • Increases consumer confidence and trust • Establishes foundation for future security standards • Addresses critical
research gap in last-mile security

Thank You
